

Tap 1 Backtest - the pullback-to-swing-high trade

Entry: the Tap 1 session's close, taken only when it closes ABOVE the 26-week breakout level | Target: the first swing high after the breakout (sell limit) | Stop: the 26W breakout level (stop order) | Time stop: 90 trading sessions

Generated 06-Oct-2026 18:11 by tap1_backtest.py - signal from the live ob_precision port (config.yaml defaults) - eod2 split/bonus-adjusted NSE daily data through 2026-09-25

Tap 1 events replayed (2021-present)	6689	100%
.. closed above the 26W level (rule takes these)	3705	55%
.. classified (race resolved or 90 sessions watched)	3617	54%
excluded: closed below the 26W level	2984	45%
excluded: censored at the data cutoff (unresolved, <90 sessions left)	88	1%

Trades	3,617	Win rate (target first)	47.3%
Avg win (gross)	+13.33%	Loss rate (stop first)	46.1%
Avg loss (gross)	-7.95%	Timeout rate	6.6%
Avg timeout (gross)	-4.39%	Median win completes in	11 sessions
Expectancy / trade (net)	+2.14%	Expectancy (R)	+1.09
Profit factor (gross)	1.72	Median reward:risk at entry	1.3x
Best trade (net)	+83.8%	Worst trade (net)	-58.6%
Median trade (net)	+0.13%	Round-trip cost	0.22%

Wins/losses are which resting order filled FIRST. Fills are gap-aware: a gap through the target fills at the open (better), a gap through the stop fills at the open (worse); a session touching both resolves by its open, else counts conservatively as a loss.

By tap year (regime check)

year	n	win	loss	timeout	avg win	avg loss	expectancy net	exp R
2021	848	51%	38%	11%	+15.6%	-7.9%	+4.55%	+0.05
2022	495	34%	60%	6%	+13.4%	-9.4%	-1.69%	-0.21
2023	784	62%	33%	5%	+12.4%	-6.1%	+5.32%	+0.81

Methodology & caveats

- Signal: Tap 1 as the live scanner defines it - the first touch of a precision order block's pre-order entry by the session low, on an armed zone (departed 1xATR, >= 3 sessions old), the first such touch of the 26W breakout cycle (alert_taps: [1]). Produced by ob_precision.replay(), the Pine-exact port the live scanner runs, with config.yaml defaults - not reimplemented here.

- 26W breakout cycles are dated from the candle-derived c02 cross (the weekly scanner's own definition, derive_26w_breakout semantics) with the 26-week cross-lock. The live waiting list additionally requires the weekly momentum gate (c03..c13), so this sample is a superset of the live feed; 96.5% of live zones since 2026-06 were reproduced exactly.

- Data: eod2 (github.com/BennyThadikaran/eod2_data) NSE daily OHLCV, adjusted for splits and bonuses (not dividends - same as the repo's Yahoo close path), through 2026-09-25. universe.csv is today's universe: 2021-era delistings are absent (survivorship).

- Point-in-time: zones are frozen at birth; the race is judged only on bars after the entry. Races that resolve early need no further data; unresolved ones at the data cutoff are excluded, not guessed.

- In-sample and descriptive: the configuration was chosen from this same history. No portfolio simulation - overlapping signals count as independent trades; capital limits, correlation and slippage beyond the flat 0.22% round trip are not modelled.

- The 26W level as stop is order-based (any low at/below the level stops the trade); the live zone invalidation is close-based and looser.

Every trade

3,617 trades, ordered by tap date. OUT = which resting order filled first (WIN target / LOSS stop / TMO time stop). Net P&L; is after the 0.22% round trip. R = net P&L; in units of the entry-to-stop risk.
