

Precision OB Entry Backtest - buy the order-block candle itself

Event: the first precision order block born after the 26W breakout (the live scanner's first_zone_after_breakout rule) | Entry: the OB candle's close, taken only when it closes ABOVE the 26-week breakout level
| Target: the first swing high after the breakout (sell limit) | Stop: the 26W breakout level (stop order) | Time stop: 90 trading sessions

Generated 06-Oct-2026 20:23 by precision_ob_backtest.py - zones from the live ob_precision port (config.yaml defaults) - eod2 split/bonus-adjusted NSE daily data through 2026-09-25

26W breakout cycles replayed (2021-present)	10,748	
.. formed a post-breakout precision OB	8,768	82%
first post-breakout OBs - the events replayed	7,357	100%
.. OB candle on/after the breakout (the pullback candle)	3,907	53%
.. OB close above the 26W level (rule takes these)	2,278	58%
.. classified (race resolved or 90 sessions watched)	2,272	31%
excluded: OB candle predates the breakout (zone born on the breakout, origin the day before)	3,450	47%
excluded: OB close back below the 26W level	1,629	22%
excluded: censored at the data cutoff (unresolved, <90 sessions)	6	0%

Trades	2,272	Win rate (target first)	88.5%
Avg win (gross)	+7.27%	Loss rate (stop first)	11.0%
Avg loss (gross)	-4.16%	Timeout rate	0.5%
Avg timeout (gross)	+2.94%	Median win completes in	1 sessions
Expectancy / trade (net)	+5.77%	Expectancy (R)	+1.62
Profit factor (gross)	14.13	Median reward:risk at entry	0.9x
Best trade (net)	+78.3%	Worst trade (net)	-34.9%
Median trade (net)	+4.41%	Round-trip cost	0.22%

The hindsight check: OB-candle close vs displacement close

The OB candle is only knowable as a precision OB once the displacement bar AFTER it closes - buying its close uses one bar of foresight. The displacement bar's close is the first price at which the OB is knowable in real time. The gap between the rows is the hindsight premium; treat entry B as the tradable version of this idea.

entry	stop	n	win	avg win	avg loss	expectancy net	exp R
A: OB candle close	26W level	2,272	89%	+7.3%	-4.2%	+5.77%	+1.62
A: OB candle close	zone stop	3,887	70%	+10.5%	-2.2%	+6.75%	+3.91
B: displacement close	26W level	6,624	83%	+3.0%	-5.3%	+1.32%	+0.60
B: displacement close	zone stop	7,323	86%	+3.6%	-10.4%	+1.53%	+0.14

Fixed-hold returns from the OB close (no target, no stop - hold N sessions)

horizon	n	mean gross	median	win	mean net
5d	3,898	+11.29%	+9.10%	93%	+11.07%
15d	3,871	+12.56%	+9.65%	82%	+12.34%
30d	3,806	+14.04%	+9.99%	75%	+13.82%
45d	3,736	+16.59%	+11.29%	73%	+16.37%

target beyond 5%	1,225	84%	15%	1%	+11.4%	-5.2%	+8.60%	+2.26

Methodology & caveats

- Signal: the first precision order block born on/after the 26W breakout session, per breakout cycle - the live scanner's own `first_zone_after_breakout` rule, applied to every historical cycle. Zones come from `ob_precision.replay()`, the Pine-exact port the live scanner runs, with `config.yaml` defaults: `zone` = the origin candle's open-to-low, `origin` = the nearest bearish or neutral candle within 8 bars before a displacement (`close > 8-bar structure`, `rvol >= 1.8`, `range >= 1.2 ATR`, `body >= 55%`, `close-location-value >= 0.72`).
- Entry A is the origin candle's close - the ask. It uses one bar of hindsight: the origin only becomes a precision OB when the displacement bar after it closes. Entry B (displacement close) is reported beside it everywhere; prefer B when deciding what is actually tradable.
- The OB candle must sit on/after the breakout session and close above the 26W level. Zones born on the breakout session whose origin candle predates it (the breakout bar itself is the displacement) are counted in the funnel and excluded - the SMSPHARMA shape.
- Target = the highest high printed between the breakout session and the entry session (sell limit); stop = the 26W breakout level (stop order); 90-session time stop. Fills are gap-aware: through the target fills at the open (better), through the stop at the open (worse); a session touching both resolves by its open, else counts conservatively as a loss.
- 26W breakout cycles are dated from the candle-derived c02 cross (`derive_26w_breakout` semantics) with the 26-week cross-lock. The live waiting list adds the `c03..c13` weekly momentum gate, so this sample is a superset of the live feed.
- Data: `eod2` (github.com/BennyThadikaran/eod2_data) NSE daily OHLCV, adjusted for splits and bonuses, through 2026-09-25. `universe.csv` is today's universe: 2021-era delistings are absent (survivorship).
- In-sample and descriptive: the configuration was chosen from this same history (it is the accepted Tap 1 configuration with an earlier entry). No portfolio simulation - overlapping signals count as independent trades; capital limits, correlation and slippage beyond the flat 0.22% round trip are not modelled.
- The 26W level as stop is order-based (any low at/below the level stops the trade); the live zone invalidation is close-based and looser.

Every trade

2,272 trades, ordered by OB-candle date. OUT = which resting order filled first (WIN target / LOSS stop / TMO time stop). Net P&L; is after the 0.22% round trip. R = net P&L; in units of the entry-to-stop risk. off = sessions the OB candle sits before the displacement bar; rvol = the displacement bar's relative volume; disp = the displacement (zone birth) date.
